- CHANGELOG 0.1.7.dev
 - 0.1.7 xl2roefact.RDINV invoice items & metadata (231126 h05:00)

CHANGELOG 0.1.7.dev

0.1.7 x12roefact.RDINV invoice items & metadata (231126 h05:00)

- left OPEN ISSUES in this release [piu@231126: marked on todo plan of 0.1.8 version]
 - ✓ (CLOSED@231213) file x12roefact/rdinv.py, function __mk_kv_invoice_items_area(...): FIXME this will be identified in invoice_header_area ==> should be changed accordingly
 - --> file x12roefact\invoice_files/_PLAN_model_test_factura_generat_anaf.xml, line 114:

 <cbc:ID>S</cbc:ID> #FIXME clarify.me_ pare a fi TIPUL PRODUSULUI: (S)erviciu sau ???

 (P)rodus sau ???
- 231126piu_a item(s) line extensions == item VAT total, item VALUE total
- 231125piu_c changed dir excel_invoices/ with invoice_files/
- 231125piu_b make a plan from __model_test_factura_generat_anaf.xml marking TODOs & DONE tags & renaming as _PLAN_...idem...
- 231125piu_a final review, complete find of invoice relevant columns and write them in invoice dict:
 - quantity (cbc:InvoicedQuantity),
 - VAT percent (cbc:Percent),
 - description (cbc:Name),
 - uom (cbc:unitCode),
 - unit price (cbc:PriceAmount),
 - currency (c:currencyID)
- 231224piu_a FIXED VAT calculation for lines which specify a VAT as 0% USE CASE lines for other taxes like
 "acciza"... still unsolved for very simplified invoices (see code line containing text "_vat_percent_calculation
 should also")
- 231123piu_c rdinv module, defined function libutils.isnumber(a_string: str) -> bool to test is a string is valid as any kind of number
- 231123piu_b rdinv module, function to search for a list of string in a list items (suitable to identify useful / relevant invoice columns from Excel format) ==> __find_str_in_list(str_to_find: str, list_to_search: list)

- 231123piu_a prepared function __mk_kv_invoice_items_area(...) to transform invoice_items_area in "canonical JSON format" (as kv pairs)
- 231122piu_a invoice_items_area & meta_info review, check and clean code
- 231121piu_a final invoice dict / JSON data: moved all effective data under key "excel_data" (preparing so for final storable invoice "real keys")
- 231119piu_b invoice_items_area set unknown rows header to <current line number>.NOTE-<seq>, where seq is an ordered sequence of letters (ie, resulting something like: 1.a, 1.b, ...) * 231119piu_a closed:
 - ✓ invoice meta_info area
 - ✓ a more defined, clean & clear invoice_items_area
 - ✓ add last_processing_UTCtime in meta_info dictionary
 - written invoice dict to a JSON (f-JSON file, see doc:
 https://apitoroefact.renware.eu/commercial_agreement/110-SREapi_to_roefact_requirements.html#vedere-de-ansamblu-a-solutiei)
- 231112piu_a refactor:
 - base_proc to x12roefact
 - ✓ BASE_PROC to x12roefact
 - update documentation
 - publish site
- 231109piu_a installed module pylightxl in base environment (ie, in project root) to allow modules calling from root for future web components & updated requirements.txt
- 231108piu_f RDINV (rdinv.py) secure for "unwanted crashes" errors (missing info) & clean code
- 2811080iu_e install mkdocstrings, update mkdocs.yml and create a markdown document for xl2roefact component (did) not succeeded search for 'FIXME temporary disabled because errs' ...longer_string_...
- 231108piu_d documented that XLSX is the only Excel file format supported (in 110-SRE-api_roefact_requirements.md) & published site
- 231108piu_c xl2roefact (xl2roefact.py) transformed in class & parametrized worksheet name containing invoice ==> class BaseProc()
- 231108piu_b RDINV (rdinv.py) module set directories environment & open invoice
- 231108piu_a consolidate decomposition (from 231107piu_c) ==> directory .../xl2roefact/modules/
- 231107piu_c transform decomposition (from 231107piu_b) into complete Python modules (making directories for each)
- 231107piu_b created module files according to decomposition (specs doc 110-SRE-api_to_roefact_requirements.md)
- 230107piu_a made a first DRAFT runnable CLI program with Typer (https://typer.tiangolo.com/) from xls2xml.py ==> dist/xls2xml.exe
